

Godot Editor Introduction

LEARNING OBJECTIVES

You get familiar with the Godot Editor and create your first scene. You learn the three core concepts **Scenes, Nodes and Scripts** and run your first project.

01 Editor Layout ◦

Open an empty Godot project and explore the interface. Identify the following areas and describe their purpose. Use the Godot documentation (see Resources) for reference.

RESOURCES

 **Godot Docs: Editor**

ACCEPTANCE REQUIREMENTS

- ☐ A `.tscn` file with `Node2D` as the root and at least one child node is present.
- ☐ A script is attached; the `print()` output is visible in the Output panel.

02 Build a Scene ◇

Create a new 2D scene with `Node2D` as the root node. Add a `Label` node as a child and change its text in the Inspector.

Save the scene as a `.tscn` file inside your project folder.

03 Write and Run a Script ▷

Attach a `GDScript` to the `Node2D`. Define a variable and print its value in `_ready()` using `print()`.

```
# Example code structure
extends Node2D
var message = "Hello Godot"
func _ready():
    print(message)
```

Run the scene (**F6**) and verify the output in the Output panel.
