

Assignment 1a – Godot Editor Introduction

01 Editor Layout

Viewport & Context Switcher

The **Viewport** is the central area of the Godot editor where the current scene is displayed and edited visually. It is the main workspace in which nodes can be selected, moved, scaled, and arranged directly on screen.

The **Context Switcher** is the row of buttons at the top of the editor (*2D*, *3D*, *Script*, *AssetLib*) that changes what the viewport shows. It allows switching between the 2D workspace, the 3D workspace, the script editor, and the asset library without leaving the editor.

Scene Dock

The **Scene Dock**, located in the upper-left area of the editor, displays the hierarchical tree of all nodes that make up the currently open scene. Nodes can be added, removed, renamed, reordered, and organized into parent-child relationships from this dock. It provides the structural overview of the scene and is the main place where the composition of a scene is managed.

Inspector

The **Inspector**, on the right side of the editor, shows all properties and exported variables of the node that is currently selected in the Scene Dock. From here, values such as position, rotation, scale, text, color, or any custom script variable can be viewed and modified without writing code. It is the primary tool for configuring individual nodes.

FileSystem Dock

The **FileSystem Dock**, located in the lower-left area of the editor, is the file browser of the project. It lists every resource stored in the project folder, including scenes (**.tscn**), scripts (**.gd**), images, audio files, and other assets, organized in directories. Files can be opened, renamed, moved, or dragged directly into the scene or the Inspector from this dock.
