

Dodge the Creeps - Your First 2D Game

LEARNING OBJECTIVES

You build "Dodge the Creeps", the official beginner tutorial project from the Godot documentation. You learn about **scene instancing**, **physics nodes**, **timers** and a **heads-up display**, and implement a complete game loop with start, game over and restart.

01 Requirements ◦

Build the game "Dodge the Creeps" following the official Godot documentation (see Resources). The player moves in all directions and must dodge enemies. The game tracks survival time as the score.

Player

Create a player scene. The player moves in all four directions and plays matching animations. Contact with an enemy hides the player and ends the game.

Enemies

Create an enemy scene. Enemies spawn randomly at the screen edge, move in a straight line, and remove themselves when they leave the screen. Animation type and speed vary.

Game Flow and HUD

Implement a complete game flow with a start screen, a running game state and a game over state. The score increases every second and is visible in the heads-up display. The game can be restarted without closing the application.

Background and Sound

Add a background and sound effects. The game should have background music and a sound effect on game over.

Keyboard Shortcut

Assign a keyboard shortcut to the start button so the game can also be started without a mouse.

The documentation walks you through every part of the game step by step. The required assets can be downloaded directly via the link in the Resources section.

ACCEPTANCE REQUIREMENTS

☐ All requirements from Task 01 are met and the game is playable.

☐ **Bonus:** All bonus requirements from Task 02 are met.

02 Bonus (+1 Point) ★

Increasing Difficulty

Enemies should get faster or spawn more frequently over time so that the difficulty increases continuously.

Highscore

After the game ends, display the highest score achieved during the current session.
